

How to put figures into LaTeX

Evan Huynh, Waseem Totonji

March 28, 2018

Abstract

I made two figures in Mathematica and now it is time to get them into the text.

1 Two figures

Important that eps-file lies in same folder as this tex-document.

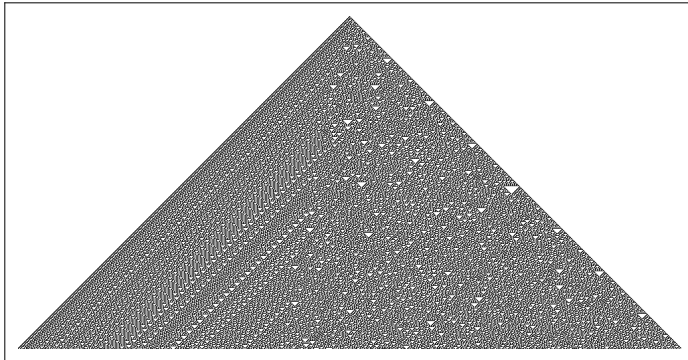

Figure 1: This figure illustrates three geometrical concepts. Point, circle and line.

There it came! Now we have a look at the second figure.

To get it on paper you use Build in TeXnicCenter. If you have eps-files use LaTeX \rightarrow PS \rightarrow PDF in the box. Figure 2 came out below this text. Disturbed by Out sign in plots? You can cut them in Mathematica. Do you want frame, axes labels etc for your plot? No problem, see Plot command in Mathematica. You write Plot, mark it with mouse and select Find Selected Function in the help menu.

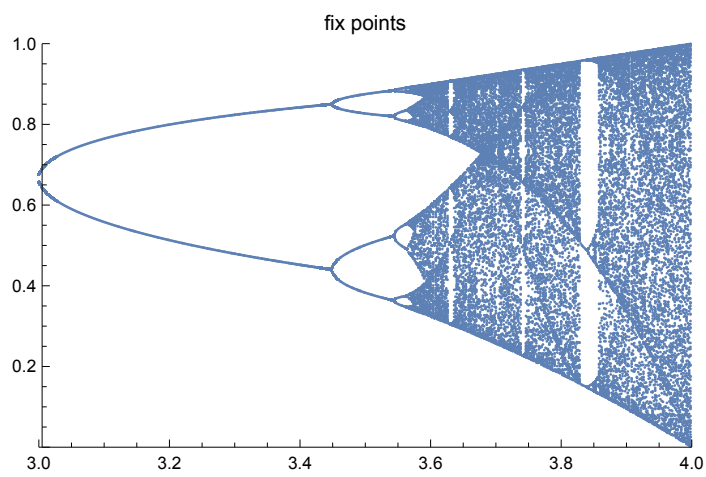

Figure 2: The curve is $\sin x$ and the line $\frac{x}{2}$. To solve the equation $\sin x = \frac{x}{2}$ a numerical method is needed.
